Don't Save

Save

Press the "Save" Icon.
If you press "Don't Save", the lines will still be shifted, until you turn the screen on again next time.

Save

All Lines have now moved to your current position and Offline Distance is now reading Zero

**Press the Red X to get your normal Icons back on the screen**

After doing this, you are ready to engage on your newly shifted line and keep on working.. If you wanted to tidy things up a bit, then follow the se steps:

* When going in to work in an existing Field, it will give you the option to select a Stored AB Line, as shown below.

Select Stored AB Line

Use Arrows to scroll through all Available Lines

1.49 km

Currently Named Line will be shown in Red

AB Line Name: AB Line 1

0.0

This Field Has 3 different sets of Lines in it. A Typical field will have at least one set of Straight or Curved lines, as well as a Headland.
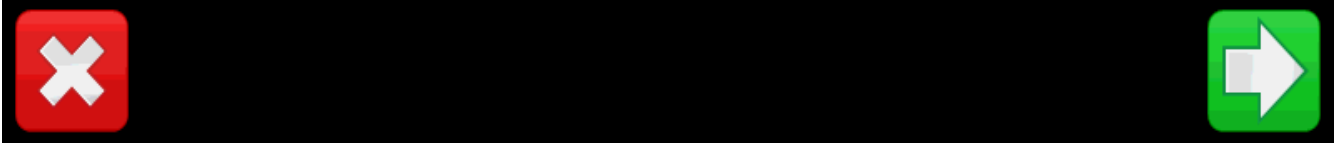

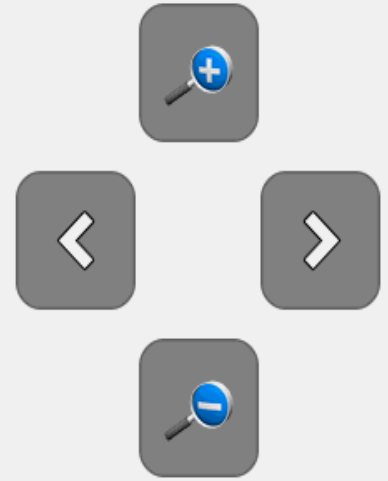

Select Stored AB Line

1.49 km

Notice that it looks like the Same AB Line on the Map, but has a different Name. As it is only shifted by 19cm, they are very close.

SR 19cm means that this is the version of the Line that has been shifted Right by 19cm

0.0
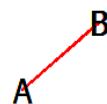

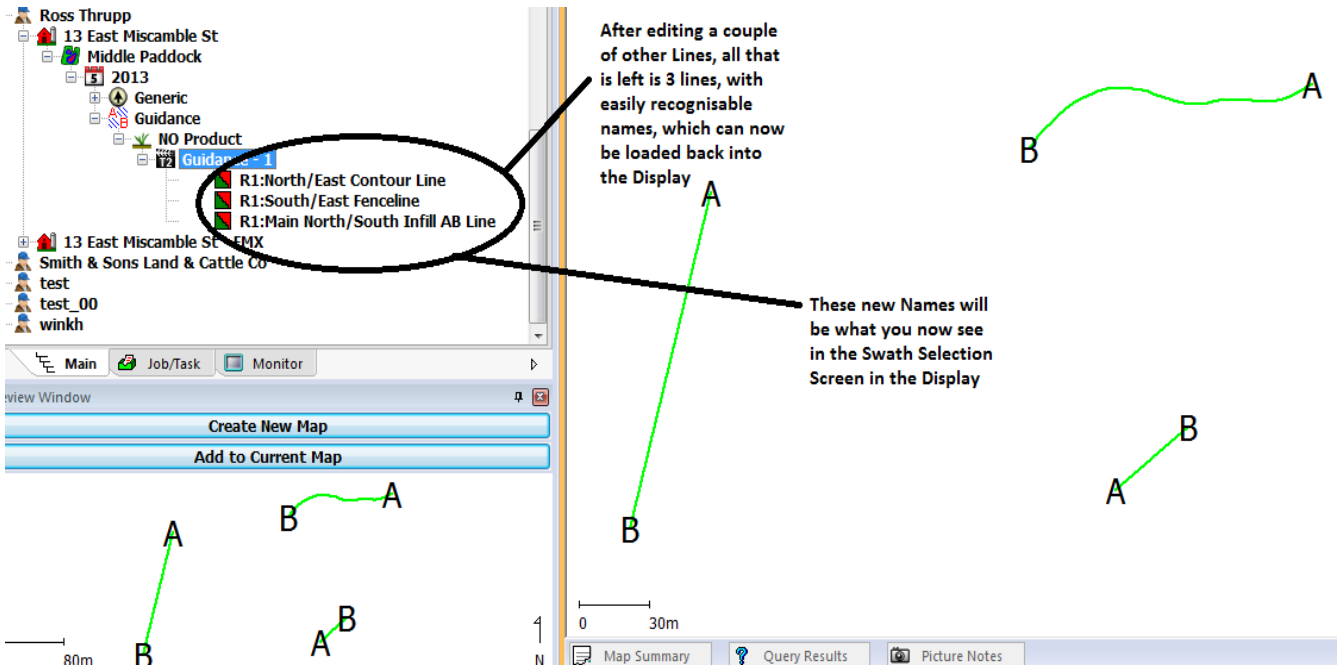

AB Line Name: AB Line 1, SR 19cm

If you take note of which lines you are using (& the ones you aren't), then I can run your data through my PC to Edit these Names and Delete unwanted lines as follows:

These Lines can now be Imported into my mapping program, where I can Rename the "SR 19cm" Line and Delete the Original AB.

After editing a couple of other Lines, all that is left is 3 lines, with easily recognisable names, which can now be loaded back into the Display

These new Names will be what you now see in the Swath Selection Screen in the Display

After loading the info back into the Display, it will come up as shown below, which will make it a lot easier to identify your correct AB Lines next time.

Select Stored AB Line
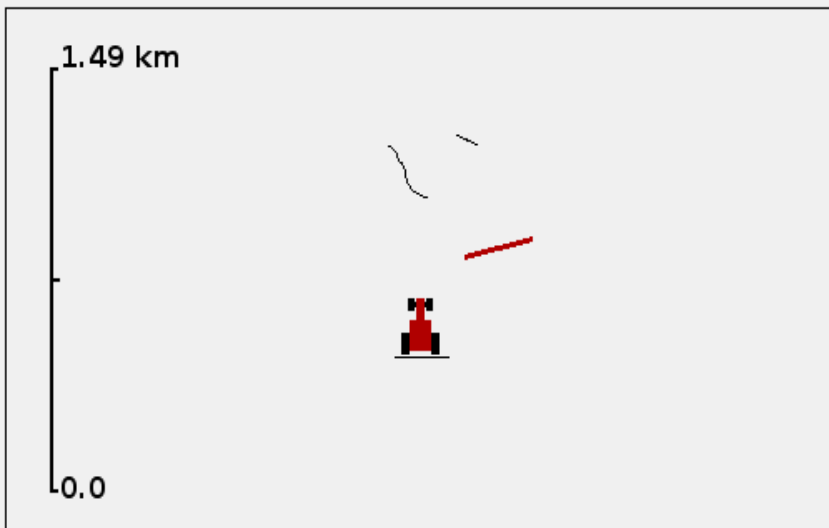

AB Line Name: Main North/South Infill AB Line 0
